Applying Control System Analysis and Design Using MATLAB

Modeling and System Representation

The starting point in control system analysis is accurate modeling. MATLAB simplifies this through functions like ``tf`` for transfer functions and ``ss`` for state-space models.

Example: Modeling a DC motor:

```
```matlab

% Transfer function of a DC motor

J = 0.01; % Moment of inertia

b = 0.1; % Viscous friction coefficient

K = 0.01; % Motor torque constant

R = 1; % Electric resistance

L = 0.5; % Electric inductance

s = tf('s');

P_motor = K/((Js + b)(Ls + R) + K^2);

```
```

This representation enables subsequent analysis and controller design grounded in Ogata's modeling principles.

Analyzing System Response

Once modeled, engineers analyze transient and steady-state behavior:

- Time Response: Using ``step`` and ``impz`` to observe system behavior.
- Frequency Response: Using ``bode`` and ``nyquist`` plots to examine gain and phase margins.

Example:

```
```matlab
```

```
figure;

step(P_motor);

title('DC Motor Step Response');

````
```

This visualization helps in understanding the system's stability and responsiveness, key considerations in Ogata's control design framework.

Designing Controllers

Based on analysis, controllers are designed to meet specified performance criteria such as stability, overshoot, and settling time.

PID Controller Design:

```
``matlab  
  
C = pid(1, 0.1, 0.01); % Proportional-Integral-Derivative controller  
  
T_closed = feedback(CP_motor, 1);  
  
step(T_closed);  
  
title('Closed-Loop Response with PID Controller');  
  
````
```

Root Locus Method:

```
``matlab

rlocus(P_motor);

````
```

This graphical method illustrates how the poles of the closed-loop system move with controller gain adjustments, aligning with Ogata's root locus techniques.

Advanced Topics in MATLAB for Control Engineering as per Ogata

State-Space Control and Modern Techniques

Ogata emphasizes the importance of state-space models for modern control design. MATLAB facilitates this through commands like ``ctrb``, ``obsv``, ``place``, and ``lqr``.

Controllability and Observability:

```
```matlab
```

```
A = [0 1; -2 -3];
```

```
B = [0; 1];
```

```
C = [1 0];
```

```
D = 0;
```

```
sys_ss = ss(A, B, C, D);
```

```
co = ctrb(sys_ss);
```

```
ob = obsv(sys_ss);
```

```
```
```

Pole Placement:

```
```matlab
```

```
desired_poles = [-2, -3];
```

```
K = place(A, B, desired_poles);
```

```
```
```

Optimal Control:

```
```matlab
```

```
Q = C'C;
```

```
R = 1;
```

```
K_lqr = lqr(A, B, Q, R);
```

```
...
```

These capabilities directly support Ogata's modern control design teachings.

## Digital Control System Design

The transition from continuous to discrete systems is seamlessly managed in MATLAB:

```
```matlab
```

```
Ts = 0.01; % Sampling time
```

```
sys_d = c2d(P_motor, Ts, 'zoh');
```

```
...
```

Designing digital controllers involves discretizing analog controllers or directly designing in the z-domain, enabling implementation in digital control hardware.
