Core Concepts in Easton 5th Edition

Cost Classifications and Behavior

A deep understanding of costs is fundamental in managerial accounting. Easton emphasizes the classification of costs based on behavior and relevance to decision-making.

Types of costs include:

- **Fixed Costs:** Remain constant regardless of activity level (e.g., rent, salaries)
- **Variable Costs:** Change proportionally with activity (e.g., raw materials, direct labor)
- **Mixed Costs:** Contain elements of both fixed and variable costs

Cost behavior analysis helps managers predict how costs will change with different levels of activity, enabling more accurate budgeting and planning.

Cost-Volume-Profit (CVP) Analysis

CVP analysis is a core tool explained in detail in Easton's text, illustrating how sales volume, costs, and profits interrelate.

Key components include:

- **Contribution Margin:** Sales revenue minus variable costs
- **Break-even Point:** The sales level at which net income is zero
- **Margin of Safety:** The difference between actual sales and break-even sales
- **Target Profit Analysis:** Determining sales needed to reach specific profit goals

This analysis assists managers in strategic planning and risk assessment.

Budgeting and Variance Analysis

Easton emphasizes the importance of budgets as planning tools and variance analysis as control

mechanisms.

Budget types covered:

- Operating budgets
- Financial budgets
- Master budgets

Variance analysis involves comparing actual results with budgeted figures to identify deviations and take corrective actions. Types of variances include:

- Sales Variance
- Cost Variance
- Profit Variance

- Direct vs. Indirect Costs: Direct costs can be traced to a cost object; indirect costs cannot.
- Fixed vs. Variable Costs: Fixed costs remain unchanged with activity level; variable costs fluctuate.
- Product vs. Period Costs: Product costs are associated with manufacturing; period costs relate to time periods, like selling expenses.

This chapter also discusses the purpose of cost data: supporting planning, controlling, and decision-making.

An essential tool for managers, CVP analysis helps understand how profit changes with sales volume, costs, and price changes.

Deep insights include:

- Break-even point calculations.

Sample Solutions for Common Financial Accounting Problems

Below are illustrative solutions to typical problems faced in Module 9:

Problem 1: Analyzing a Company's Liquidity

Scenario:

A company's balance sheet shows current assets of \$500,000 and current liabilities of \$250,000.

Solution:

Calculate the current ratio:

$$\text{Current Ratio} = \text{Current Assets} / \text{Current Liabilities} = \$500,000 / \$250,000 = 2.0$$

Interpretation:

A current ratio of 2.0 indicates good short-term liquidity, suggesting the company can comfortably meet its short-term obligations.

Problem 2: Choosing Inventory Valuation Method

Scenario:

A company with rising inventory costs needs to decide between FIFO and LIFO.

Solution:

- FIFO (First-In, First-Out) results in lower cost of goods sold and higher net income during inflation, but higher taxes.
- LIFO (Last-In, First-Out) aligns with current costs, reducing taxable income and income taxes but may understate inventory value.

Strategic Advice:

Select FIFO if the focus is on showing higher profits; choose LIFO for tax advantages during inflation periods.

Problem 3: Recording Depreciation

Scenario:

A machine costing \$100,000 with an estimated useful life of 10 years and salvage value of \$10,000.

Solution:

Straight-line depreciation per year:

$$(\text{Cost} - \text{Salvage Value}) / \text{Useful Life} = (\$100,000 - \$10,000) / 10 = \$9,000$$

Application:

Record \$9,000 as depreciation expense annually for 10 years, reducing the book value of the asset accordingly.
