Examples of Common Exercises and Their Solutions

Example 1: Consumer Utility Maximization

Question:

Suppose a consumer has a utility function $U(x, y) = x^{0.5} y^{0.5}$, with a budget constraint of $2x + y = 10$. Find the optimal consumption bundle.

Solution Outline:

- Write the problem as maximizing $U(x, y)$ subject to the budget constraint.
- Set up the Lagrangian:

$$\mathcal{L} = x^{0.5} y^{0.5} + \lambda (10 - 2x - y)$$

- Find first-order conditions:

$$\frac{\partial \mathcal{L}}{\partial x} = 0.5 x^{-0.5} y^{0.5} - 2\lambda = 0$$

$$\frac{\partial \mathcal{L}}{\partial y} = 0.5 x^{0.5} y^{-0.5} - \lambda = 0$$

- Solve for x and y by equating the ratios derived from the FOCs.
- Find the optimal bundle:

- From the ratio:

$$\frac{0.5 x^{-0.5} y^{0.5}}{0.5 x^{0.5} y^{-0.5}} = 2$$

Simplifies to $y = x$.

- Plug into the budget constraint:

$$\lfloor 2x + y = 10 \rightarrow 2x + x = 10 \rightarrow 3x = 10 \rightarrow x = \frac{10}{3} \rfloor$$

$$\lfloor y = x = \frac{10}{3} \rfloor$$

Answer:

Optimal consumption bundle: $\left(\frac{10}{3}, \frac{10}{3} \right)$.

Example 2: Cost Minimization

Question:

A firm produces output (q) using two inputs (x_1) and (x_2) with the production function $(q = x_1^{0.5} x_2^{0.5})$. The prices are $(w_1 = 4)$ and $(w_2 = 2)$. Find the cost-minimizing input combination to produce 16 units of output.

Solution Outline:

- Write the cost function:

$$\lfloor C = 4x_1 + 2x_2 \rfloor$$

- Set the production constraint:

$$\lfloor 16 = x_1^{0.5} x_2^{0.5} \rightarrow x_1 x_2 = 256 \rfloor$$

- Use the method of Lagrange multipliers to minimize (C) subject to $(x_1 x_2 = 256)$.
- Formulate the Lagrangian:

$$\lfloor \mathcal{L} = 4x_1 + 2x_2 + \lambda (256 - x_1 x_2) \rfloor$$

- Derive the first-order conditions:

$$\lfloor \frac{\partial \mathcal{L}}{\partial x_1} = 4 - \lambda x_2 = 0 \rightarrow \lambda = \frac{4}{x_2} \rfloor$$

$$\lfloor \frac{\partial \mathcal{L}}{\partial x_2} = 2 - \lambda x_1 = 0 \rightarrow \lambda = \frac{2}{x_1} \rfloor$$

- Equate the two expressions for λ :

$$\frac{4}{x_2} = \frac{2}{x_1} \rightarrow 4x_1 = 2x_2 \rightarrow 2x_1 = x_2$$

- Use the production constraint:

$$x_1 x_2 = 256 \rightarrow x_1 (2x_1) = 256 \rightarrow 2x_1^2 = 256 \rightarrow x_1^2 = 128 \rightarrow x_1 = \sqrt{128}$$

$$x_2 = 2x_1 = 2 \times \sqrt{128}$$

- Calculate the optimal inputs:

$$x_1 = \sqrt{128} \approx 11.31$$

$$x_2 \approx 2 \times 11.31 \approx 22.62$$

Answer:

Optimal input combination: approximately $(x_1 = 11.31)$, $(x_2 = 22.62)$.

Historical Background of Analysis

The origins of analysis trace back to the 17th century with the development of calculus by Isaac Newton and Gottfried Wilhelm Leibniz. Their groundbreaking work introduced the fundamental ideas of differentiation and integration. Over time, mathematicians formalized these concepts, leading to the rigorous foundations of analysis in the 19th century?primarily through the work of Augustin-Louis Cauchy, Karl Weierstrass, and others.

Core Objectives of Analysis

- To rigorously define limits, continuity, derivatives, and integrals
- To analyze the behavior of mathematical systems under various operations
- To provide tools for solving real-world problems involving change and accumulation

Branches of Analysis

Analysis is a broad field with several interconnected branches, each focusing on different aspects of mathematical concepts.

Real Analysis

Real analysis deals with real numbers and real-valued functions. It explores the properties of

sequences, series, limits, continuity, differentiation, and integration in the context of real numbers.

Complex Analysis

Complex analysis studies functions of complex variables. It involves the analysis of holomorphic functions, complex integration, and conformal mappings, with applications in physics and engineering.

Limits and Continuity

- Limit: Describes the behavior of a function as the input approaches a specific point.
- Continuity: A function is continuous if small changes in input lead to small changes in output. Formally, a function f is continuous at a point c if $\lim_{x \rightarrow c} f(x) = f(c)$.

Differentiation

Differentiation measures how a function changes at a point. The derivative $f'(x)$ indicates the slope of the tangent line to the graph of f .

Integration

Integration accumulates quantities such as area under a curve. The definite integral $\int_a^b f(x) dx$ computes the accumulation of f from a to b .

Sequences and Series

- Sequences: Ordered lists of numbers that approach a limit.
- Series: Sum of the terms of a sequence. Convergence or divergence of series is a central topic in analysis.

Key Theorems and Principles

Several fundamental theorems form the backbone of analysis, providing tools for understanding and solving problems.

Limit Theorems

- Squeeze Theorem: If $f(x) \leq g(x) \leq h(x)$ near a point and $\lim_{x \rightarrow c} f(x) = \lim_{x \rightarrow c} h(x) = L$, then $\lim_{x \rightarrow c} g(x) = L$.

Continuity Theorems

- Intermediate Value Theorem: If f is continuous on $[a, b]$ and d is between $f(a)$ and $f(b)$, then there exists $c \in [a, b]$ such that $f(c) = d$.

Differentiation and Integration Theorems

- Mean Value Theorem: There exists some $c \in (a, b)$ such that $f'(c) = \frac{f(b) - f(a)}{b - a}$.
