Sample Biology Questions and Solutions for O Level UCE

Below are some typical questions you might encounter, along with detailed solutions to guide your understanding.

Question 1: Describe the structure and function of a typical plant cell.

Solution:

A typical plant cell has several key components:

- **Cell Wall:** Provides structural support and protection. Composed mainly of cellulose.
- **Cell Membrane:** Controls the movement of substances in and out of the cell.
- **Chloroplasts:** Contain chlorophyll and are sites of photosynthesis, enabling the plant to make food.
- **Nucleus:** Controls cell activities and contains genetic material.
- **Vacuole:** Stores cell sap, maintains turgor pressure, and supports the cell structure.

- **Cytoplasm:** Gel-like substance where organelles are suspended, facilitating cellular processes.

The main function of a plant cell is to carry out photosynthesis, support the plant structure, and facilitate growth and reproduction.

Question 2: Explain the process of photosynthesis and its importance.

Solution:

Photosynthesis is a process by which green plants, algae, and some bacteria convert light energy into chemical energy stored in glucose molecules. The general equation is:

Carbon dioxide + Water → Glucose + Oxygen

- **Light Absorption:** Chlorophyll in the chloroplasts absorbs sunlight.
- **Light-Dependent Reactions:** Occur in the thylakoid membranes; light energy splits water molecules (photolysis), releasing oxygen, electrons, and protons.
- **Light-Independent Reactions (Calvin Cycle):** Occur in the stroma; carbon dioxide is fixed into glucose using ATP and NADPH produced in the light-dependent reactions.

Photosynthesis is vital because it provides oxygen for respiration and forms the base of food chains. It also influences atmospheric carbon dioxide levels, impacting climate regulation.

Question 3: Describe the human circulatory system and its main functions.

Solution:

The human circulatory system consists of the heart, blood vessels, and blood. Its main functions include:

- **Transport of Oxygen and Nutrients:** Blood carries oxygen from the lungs to body tissues and nutrients from the digestive system.
- **Removal of Waste Products:** Blood transports carbon dioxide and other waste to excretory organs.
- **Defense Against Diseases:** Blood contains white blood cells that fight infections.
- **Regulation of Body Temperature and pH:** Blood helps maintain homeostasis.

The heart pumps oxygenated blood through arteries to tissues and deoxygenated blood back via veins to the lungs for oxygenation.

Question 4: What is osmosis, and why is it important for living organisms?

Solution:

Osmosis is the movement of water molecules from a region of low solute concentration to a region of high solute concentration across a semi-permeable membrane. It is crucial because:

- Maintains cell turgor pressure, which keeps plant cells and tissues firm.
- Facilitates nutrient absorption in the intestines.
- Regulates water balance in animal cells.
- Supports processes like kidney function and blood volume regulation.

Without proper osmosis, cells can become either shriveled or burst, leading to health issues or plant wilting.

Question What are the main differences between plant and animal cells? Plant cells have cell walls, chloroplasts for photosynthesis, and a large central vacuole, whereas animal cells lack

cell walls, do not have chloroplasts, and have smaller vacuoles. Both types have a nucleus, cytoplasm, and cell membrane. How does photosynthesis occur in green plants? Photosynthesis occurs in the chloroplasts of green plants where sunlight, carbon dioxide, and water are used to produce glucose and oxygen. The process involves light-dependent and light-independent (Calvin cycle) reactions. What is the function of the human circulatory system? The circulatory system transports blood, nutrients, oxygen, and hormones to body cells and removes waste products like carbon dioxide. It also helps in temperature regulation and immune responses. Define osmosis and explain its importance in biological systems. Osmosis is the movement of water molecules from a region of high water concentration to a region of low water concentration across a semi-permeable membrane. It is essential for maintaining cell turgor and regulating water balance within organisms. What are the roles of enzymes in biological reactions? Enzymes act as biological catalysts that speed up chemical reactions in the body by lowering activation energy, allowing processes like digestion and DNA replication to occur efficiently. Describe the process of reproduction in humans. Human reproduction involves the fertilization of a female ovum by a male sperm, resulting in the formation of a zygote. The zygote develops into an embryo, which grows into a fetus and is born after pregnancy. What are the functions of the human respiratory system? The respiratory system facilitates breathing by allowing gas exchange? oxygen is taken into the lungs and transported to the blood, while carbon dioxide is removed from the blood and expelled out of the body.
