What Is Nuclear Fission?

Definition and Basic Principles

Nuclear fission is a nuclear reaction where a heavy atomic nucleus splits into two or more smaller nuclei, along with the release of a significant amount of energy. This process often involves the absorption of a neutron by a fissile nucleus, such as uranium-235 or plutonium-239, leading to instability and subsequent splitting.

The Fission Process

- The nucleus absorbs the neutron, becoming unstable.
- The nucleus splits into two smaller nuclei called fission fragments.
- Additional neutrons are released, which can initiate further fission reactions.
- A large amount of energy is released in the form of kinetic energy of the fragments, gamma radiation, and neutrinos.

Key Concepts in Fission

- Chain Reaction: The process where released neutrons trigger further fissions, sustaining the reaction.
- Critical Mass: The minimum amount of fissile material needed to maintain a chain reaction.
- Control Measures: Use of control rods and moderators to regulate the reaction rate.
