- b) Rectify AC into DC
- c) Store electrical energy
- d) Regulate voltage

Answer: b) Rectify AC into DC

Explanation:

A diode is a semiconductor device that allows current to flow in one direction only. Its primary function in circuits is to convert alternating current (AC) into direct current (DC), which is essential in power supply applications. While diodes can also be used for voltage regulation and signal demodulation, their main role in basic electronics is rectification.

P-type semiconductors are created by doping silicon with elements like boron, which create an excess of holes (positive charge carriers). These holes facilitate current flow when an electric field is applied. Conversely, n-type semiconductors are doped with elements like phosphorus, which provide excess electrons.

Question 3: In an RC circuit, what is the time constant (?) defined as?

- a) $R \times C$
- b) $R + C$
- c) R / C
- d) C / R

Answer: a) $R \times C$

Explanation:

The time constant (τ) for an RC circuit is the product of resistance (R) and capacitance (C). It indicates how quickly the capacitor charges or discharges; specifically, after a time equal to τ , the voltage across the capacitor reaches approximately 63.2% of its final value.

Question 4: Which logic gate outputs true only when all inputs are true?

- a) OR gate
- b) AND gate
- c) NAND gate
- d) NOR gate

Answer: b) AND gate

Explanation:

An AND gate outputs true only when all its inputs are true. If any input is false, the output is false. This is fundamental in digital logic design, used for conditions requiring multiple criteria to be met simultaneously.
