Understanding Flue Gas and Acid Gases

What Are Flue Gases?

Flue gases are the combustion by-products expelled through a flue or chimney. They typically contain a mixture of gases such as nitrogen, carbon dioxide, water vapor, particulate matter, and various pollutants including sulfur oxides (SO_x), nitrogen oxides (NO_x), and trace metals. The composition of flue gases depends on the fuel type, combustion conditions, and pollution control measures implemented.

Sources of Acid Gases

Acid gases primarily refer to sulfur dioxide (SO_2) and hydrogen chloride (HCl), which are generated during the combustion of sulfur-containing fuels like coal, oil, and certain waste materials. These gases are responsible for acid rain formation and pose health hazards. The main focus of acid gas removal systems is to eliminate SO_2 , which accounts for the majority of acid gas emissions.

Principles of Flue Gas Desulfurization

Basic Concept

Flue gas desulfurization (FGD) involves chemical or physical processes that remove sulfur compounds from flue gases. The core objective is to convert SO_2 into a stable by-product, often gypsum (calcium sulfate dihydrate), that can be safely disposed of or utilized.

Key Chemical Reactions

The primary reactions in FGD systems involve sulfur dioxide reacting with alkaline materials such as limestone or lime:

- Calcium carbonate (limestone) reaction:

- Quicklime (calcium oxide) reaction:

These reactions result in the formation of gypsum, which can be recovered and sold as a by-product.

Types of Acid Gas Removal Systems

Wet Flue Gas Desulfurization Systems

Wet FGD systems are the most common and involve scrubbing the flue gases with a liquid absorbent, typically a slurry of limestone or lime.

Our goal is to offer a clear, detailed understanding suitable for engineers, environmental professionals, and interested readers alike.

Understanding Flue Gas and Acid Gases

What is Flue Gas?

Flue gas is the mixture of gases that exit a combustion process, such as burning coal, oil, or natural gas. It typically contains:

- Carbon dioxide (CO₂)
